## 1 DESCRIPTION

This document describes the messages and values that can be sent on the new Market Data Platform in binary format.

### 1.1 Benefits

The new binary Market Data feed will provide the following benefits:

- SBE messaging protocol.
- Execution Summary message.

### 1.2 Contact Information

- Contact Services Department handles all requests for connectivity setup and general exchange supported services.
  - [contratacao@b3.com.br](mailto:contratacao@b3.com.br)
  - +55 11 2565-5081
- Certification and Testing Center: performs certification of all software solutions applying for EntryPoint connectivity.
  - [tradingcertification@b3.com.br](mailto:tradingcertification@b3.com.br)
  - +55 11 2565-5029
- Trading Support Department (GSN): provides real time connectivity monitoring and troubleshooting.
  - [tradingsupport@b3.com.br](mailto:tradingsupport@b3.com.br)
  - +55 11 2565-5021

## 2 CHANGE LOG

Date	Version	Description	Author
Mar. 4 <sup>th</sup> , 2020	1.0.0	- First version.	RDRC, AYSF
Apr. 28 <sup>th</sup> , 2020	1.1	- Inclusion of LastMsgSeqNumProcessed for Snapshot messages. - Reinclusion of Heartbeat Message (distinct from SequenceReset). - Inclusion of Book Reset Message. - Inclusion of Market Data Incremental Refresh – Price message. - Parts of this document are generated by processing the SBE template.	RDRC, EEW
Jun. 25 <sup>th</sup> , 2020	1.2	- Removing duplicate messages. - Adding a message for Security Status and Phase. - Adding a LastTradePrice. - Adding messages for High Price and Low Price. - Template version: 1.1	EEW
Feb. 16 <sup>th</sup> , 2022	1.3	- Removing MBE messages. - Streamlining several messages. - Restoring some fields from UMDF FIX/FAST spec. - Template version: 1.3	EEW, RNKH
Mar. 3 <sup>rd</sup> , 2022	1.3.1	- Updating messages TheoreticalOpeningPrice and LastTradePrice. - Template version: 1.3.1	EEW
Apr. 6 <sup>th</sup> , 2022	1.3.2	- Minor edits.	EEW
Apr. 28 <sup>th</sup> , 2022	1.3.3	- Fields reordered and padding added. Some common fields are placed at fixed offsets. - Fields added to or removed from messages: ClosingPrice, DeleteOrder, EmptyBook, LastTradePrice, Trade, News. - Template Version: 1.3.3	EEW, RNKH
May 30 <sup>th</sup> , 2022	1.4.0	- New messages ExecutionSummary and ExecutionStatistics, GroupPhaseStatus, MassDeleteOrders, ForwardTrade. - Fields added to or removed from messages: Trade. - Fields reordered. - Template Version: 1.4.0	RNKH, EEW
Jun. 23 <sup>th</sup> , 2022	1.4.1	- Field and message paddings are shown in the message descriptions. - Template Version: 1.4.0	EEW
Jul. 7 <sup>th</sup> , 2022	1.5.0	- New messages (ChannelReset, TradeBust). - New fields: RptSeq, LastRptSeq, NumberOfTrades. - Fields renamed: OrderID → SecondaryOrderID.	EEW, RNKH
Sep. 13 <sup>th</sup> , 2022	1.5.1	- mDEntryTimestamp and rptSeq fields moved to the end of the message. - streamID field removed in all messages. - mDEntryPositionNo field is required now. - mDEntryPositionNo and enteringFirm fields moved just after mDEntrySize field in the Order_MBO message. - tradeDate field is required now and also included in the ExecutionStatistics message. - totNumReport field removed from SecurityDefinition message. - priceLimitType field in PriceBand message is required now.	RNKH, EEW

# Market Data B3: Binary UMDF

## MESSAGE REFERENCE – VERSION 2.1.0

Date	Version	Description	Author
		<ul style="list-style-type: none"><li>- <i>transactTime</i> field replaces <i>mdEntryTimestamp</i> field in Order_MBO, DeleteOrder_MBO, MassDeleteOrders, ExecutionSummary, Trade, ForwardTrade and TradeBust messages.</li><li>- Optional <i>lastSequenceVersion</i> field (tag 37084) added at the end of <i>SnapshotFullRefresh_Header</i> message.</li><li>- Optional <i>mdEntryPx</i> field of the deleted order included in the <i>DeleteOrder_MBO</i> message.</li></ul>	

### 3 SIMPLE BINARY ENCODING

Binary UMDF is based on the version 1.0 of the FIX Simple Binary Encoding (SBE). FIX SBE targets high performance trading systems. It is optimized for low latency of encoding and decoding while keeping bandwidth utilization reasonably small. For compatibility, it is intended to represent all FIX semantics.

The encoding standard is complementary to other FIX standards for session protocol and application-level behavior.

#### 3.1 Differences between FIX/FAST and FIX/SBE

Feature	FIX/FAST	FIX/SBE	Comments
Message Size	Unlimited	Limited by packet size (1400 bytes, including headers)	A single message in FIX/FAST can be equivalent to several messages in FIX/SBE
Chunking (Multiple parts)	Required because messages can have unlimited size. It is done in transport layer (technical header)	Application layer must handle multiple parts.	Only some messages (like News) have “parts” (continuations) in application layer.
Transport and Application Layer	MessageSequenceNumber and SendingTime are part of the message (application layer)	SequenceNumber (actually “Packet Sequence Number”) and SendingTime are sent in the packet (transport layer).	If a message must be retransmitted, it doesn’t need to be reencoded just because its “SendingTime” is updated.
Bandwidth	It is the main driver for the design of the FAST encoding.	SBE prioritizes ease of encoding and fast processing.	If SBE templates are correctly designed, bandwidth savings can be significant, but usually SBE messages are slightly larger than FAST messages.

# Market Data B3: Binary UMDF

MESSAGE REFERENCE – VERSION 2.1.0

Feature	FIX/FAST	FIX/SBE	Comments
Fixed Message Size	Almost all messages have variable message size.	Variable message size only for low-traffic, large messages; fixed message size is preferred.	Messages with fixed size have simpler and faster processing.
String Fields	String size is unlimited. Encoding for non-ASCII strings is not explicitly specified.	Fixed byte size for strings is preferred. Encoding is explicitly specified.	Some string fields were “shortened” to a more practical size.
Message Types	Few message types, with several message subtypes	One or more message types for each use case	Each MDEntryType in FIX/FAST corresponds to one or more SBE message types
Field Types	Few message types. The String type is overloaded.	Enums, sets and fixed-size strings help to specialize the field types.	Space savings; field validation; help to keep message size fixed.
Constant Fields	Constant fields (that occupy 0 bytes) are not very common in FAST because a single message has several use cases.	Constant fields are very useful in SBE because they replicate FIX fields (like MD-EntryType) without using space.	Space savings; speed.
Optional Fields	Encoded differently; preferred in FAST because sometimes omitted fields occupy just 1 or 2 bits in message.	Optional fields are encoded exactly like required fields (occupying the same space). The only difference is the special value for ‘null’.	Because optional fields don’t save space, lots of message types (according to use cases) are defined.
Default Values	FAST can define default values for fields or components of fields	SBE has no “default values”, only “null values” for optional fields. The application can choose to replace the null value with the default value.	
Timestamps	UTC, Decimal, milliseconds. Ex: Jan 31, 2022 12:38:02.456 = 20220131123802456	Nanoseconds since Jan 1, 1970 00:00:00 UTC. Example: Jan 31, 2022 12:38:02.456000000 = 1643632682456000000	Faster processing because it avoids converting to and from human-readable notation.

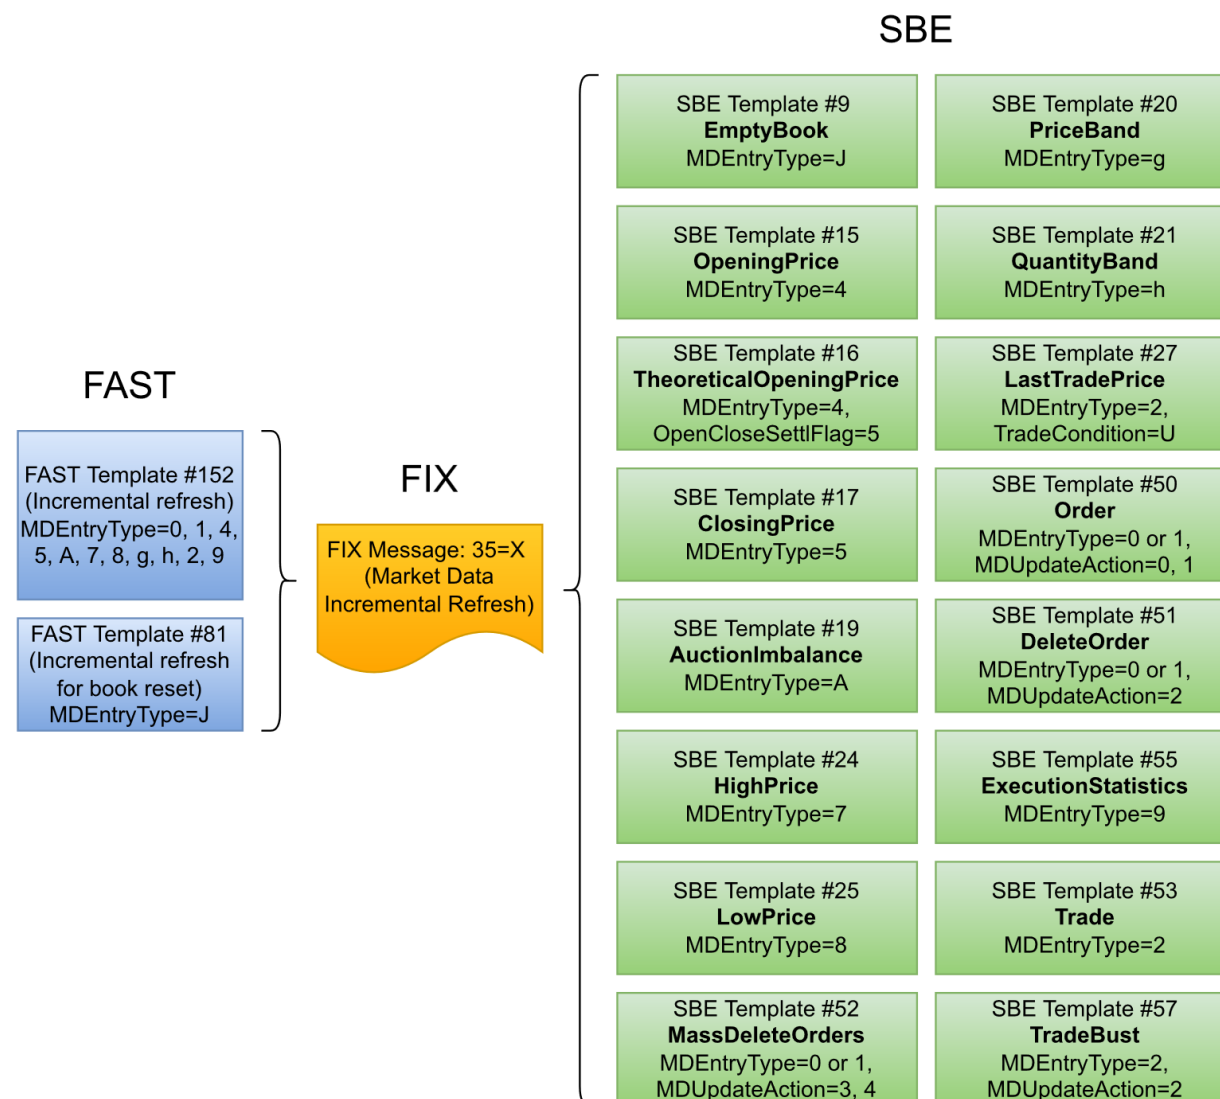

# Market Data B3: Binary UMDF

MESSAGE REFERENCE – VERSION 2.1.0

Feature	FIX/FAST	FIX/SBE	Comments
Date and Time Fields	Date and time sometimes come in separated fields. Example: MDEntryDate=20220131 and MDEntryTime=123802456	Replaced by UTC Timestamps in a single field. Example: MDEntryTimestamp = 1643632682456000000	Faster processing because it avoids separating the same information in two distinct fields.
Repeating Groups with few repetitions	Faithfully replicates FIX (Text) definition	Some repeating groups were “linearized” or “flattened” if possible	Faster processing because it avoids processing repeating groups. Example: SecurityAltID vs ISINNumber and ClearingHouse-ID.
Repeating Groups that represent large lists of related information	Faithfully replicates FIX (Text) definition	The list is represented by a sequence of messages. Sometimes it requires a “header message” as well.	SecurityList (35=y) → several SecurityDefinition (35=d), each one with a single instrument. Snapshot (35=W) → SnapshotHeader and Incremental (35=X)
Messages with variable size	Faithfully replicates FIX (Text) definition	The average message can usually fit a single packet. Some exceptionally large messages require multiple parts.	Fields “PartCount” and “PartNumber” are present in News messages.
Trivially redundant information	Faithfully replicates FIX (Text) definition	Avoided if possible	Fields “Text” and “EncodedText” in News messages were combined into a single field “Text” with UTF-8 encoding.
Combined Fields	Mutually exclusive fields (for instance, MDEntry-Buyer and MDEntrySeller in an Order message) are present. Because optional fields are cheap, they are both defined.	Combine the information into a single field.	MDEntryBuyer and MDEntrySeller were combined in a single field “EnteringFirm” in an Order message

## 3.2 Mapping FIX/FAST Messages to FIX/SBE Messages

A single kind of FIX Message can be mapped to several types of FAST or SBE messages.

For instance, the FIX “Market Data Incremental Refresh” message is mapped to 2 distinct types of FAST Messages (template #152 for the general case, and #81 for the special use case “Book Reset” with no *SecurityID*). Because optional fields are cheap in FAST (sometimes using just a single bit in message), almost all fields can be defined as optional and very few templates are required for the same FIX message.

For SBE, we map each use case to a different SBE message type, because it helps to organize use cases and keeps message size small. SBE penalizes defining optional, unused fields, because they occupy the same space of mandatory fields, so it is better to define specialized types of messages.

Usually, each distinct *Market Data Entry Type* corresponds to a distinct use case (for instance, *MDEntryType* = 7 (Session High Price) is associated to the SBE message whose template is #24).

Sometimes, a single *Market Data Entry Type* can be associated to several different SBE messages, depending on use cases, or presence of certain fields. For instance, there are four different SBE messages for *MDEntryType* value = 2 (Trade): one for a real trade (template #53), one for a trade on forward (“termo”) instruments (template #54), that includes two additional fields, one for the price of the last trade (template #27) and one for the removal operation (“trade bust”, template #57).

There are two distinct *MDEntryTypes* values (0=Bid and 1=Offer) that are associated, in FIX, with a single use case (New/Modify/Delete orders). In Binary UMDF, there will be three SBE messages: one for new or modified orders, one for deleting a single order, and one for deleting several orders at once.

### 3.3 Handling of SBE Enums and Sets

Applications must tolerate enumeration values that are not specified in the client's template. For instance, let's say that a field with *SecurityType* field (that assumes the values from 1 to 17 today) is being sent by B3 with value 18, and the client's template does not list this value. The application can choose to ignore this value.

Applications must tolerate set choices that are not specified in the client's template. For instance, let's say that a field with *TradeCondition* field has its bit 10 set (*RFQTrade*), but the client's template is not updated to support it. The application can choose to ignore this value.

### 3.4 Data Endianness

All messages and headers are represented as little-endian, even packet headers (usually encoded as big-endian in network protocols), to make encoding consistent.

### 3.5 SBE, Optional Fields and Default Values, Empty Fields

Optional fields in SBE can hold 'null values', that an application can interpret as 'absence of contents (field is not set)'.

There is no 'default values' in SBE. Applications can replace 'null values' with 'default values' if required but it is not in the protocol specification.

Optional fields in SBE do not save space at all. If a field is defined as an optional *int32* (4 bytes), it always occupies 4 bytes, even though the contents of the field are 'null' (no defined value).

For optional fields, there is a value that represents the NUL value (the field is not set). It can be specified in the declaration of their types.

If not explicitly defined in the type, the 'null' value is assumed as default for the primitive type: for unsigned fields, it is the largest possible value (something like 0xFFFF... in hexadecimal); for signed fields, it is the most negative value (something like 0x8000... in hexadecimal); for char fields, it is always the binary value 0 ('\0').

For enumeration fields, it depends on the 'encodingType' attribute (for instance, for the *LotType* enum, whose encoding type is 'uint8', the 'null' value is 255; for the *SecurityUpdateAction* enum, whose encoding type is 'char', the 'null' value is NUL ('\0').

For some types, the encoding for the 'null value' is not the default, but it is specified in the 'nullValue' attribute for the type. For instance, the type of the 'enteringFirm' field (tag 37501) is *FirmOptional*, whose 'nullValue' attribute is "0". For such field, the value "0" represents null, not zero.

There are two types of strings in SBE: variable-length strings and fixed-length strings. Null string and empty strings are encoded the same way. For variable-length strings, the field 'length' is 0 for null (empty) strings. For fixed-length strings, if the content is shorter than the specified length, must be delimited by NUL ('\0') character.

From the SBE specification, the default values for *null* values are:

Primitive Type	Value	Decimal	Hexadecimal
int8	-128	-128	0x80
uint8	255	255	0xFF
int16	-32768	-32768	0x8000
uint16	65535	65535	0xFFFF
int32	$-2^{31}$	-2147483648	0x80000000
uint32	$2^{32} - 1$	4294967295	0xFFFFFFFF
int64	$-2^{63}$	-9223372036854775808	0x8000000000000000
uint64	$2^{64} - 1$	18446744073709551615	0xFFFFFFFFFFFFFFFF
char	0 (ASCII NULL)	0	'\0'
decimal (int32 mantissa)	Mantissa: $-2^{31}$	-2147483648	0x80000000
decimal (int64 mantissa)	Mantissa: $-2^{63}$	-9223372036854775808	0x8000000000000000

### 3.5.1 Decimal 'null' values

For instance, the type 'Price' is defined as a Decimal; the mantissa type is '*int64*' and the exponent is fixed as -4. A price like '+12.34' is encoded as the long value '123400' (it is 12.34 times  $10^4$ , or 10000) but the *null* price (that can be found in market orders, that have no defined price) is encoded as the special value 0x8000000000000000, or -9223372036854775808.

For some decimal fields, it is possible to have null values encoded as '0' instead. Typically, they are values that are strictly positive (cannot assume the value 0.0). Check the SBE template: searching for *nullValue* attribute in type declaration.

### 4 DATATYPES

Type	Description	Size (Bytes)
uint8	8-bit Unsigned Integer (Little Endian encoding)	1
int8	8-bit Signed Integer (Little Endian encoding)	1
uint16	16-bit Unsigned Integer (Little Endian encoding)	2
int16	16-bit Signed Integer (Little Endian encoding)	2
uint32	32-bit Unsigned Integer (Little Endian encoding)	4
int32	32-bit Signed Integer (Little Endian encoding)	4
uint64	64-bit Unsigned Integer (Little Endian encoding)	8
int64	64-bit Signed Integer (Little Endian encoding)	8
Boolean	True (1) or False (0)	1
char	1 ASCII character	1
char(N)	Fixed length string padded on the right with null bytes. Encoding is US-ASCII, except when specified by the template.	N
Price	A decimal fixed-point number with <b>scale = 4</b> , representing a price. For instance, \$1.23 will be represented by 12300.	8
Qty	A 32-bit signed integer, representing a quantity.	8
UTCTimestampNanos	Number of nanoseconds since UNIX Epoch (January 1 <sup>st</sup> , 1970, UTC) with millisecond accuracy. Example: 1582821143123000000 represents Thursday, February 27, 2020 16:32:23.123 in UTC.	8
ISINNumber	ISO 6166 12-letter ISIN (International Securities Identification Number). Example: BRB3SAACNOR6	12
LanguageCode	ISO 639-1 two-letter language code. Example: "pt" (Portuguese), "en" (English)	2
LocalMktDate	Local date (as opposed to UTC). Number of days since UNIX Epoch (January 1 <sup>st</sup> , 1970). Example: 18319 represents February 27, 2020.	2

MonthYear	Local year and month (as opposed to UTC). Represented with two subfields: year (0000 – 9999) and month (1 – 12).	3
Currency	3-letter <i>alphabetic</i> ISO Currency Codes (ISO 4217). Example: BRL, USD.	3
Fixed(n)	A decimal fixed-point number with exponent -n (i.e., n places after the decimal separator). For instance, the number 42.28456973 will be represented as a Fixed(8) with mantissa = 4228456973 and exponent = -8.	8
Percentage	A decimal fixed-point number with exponent = -4 (Basis points). For instance, a percentage of 1% is represented as 0.01 (Mantissa = 100, Exponent = -4) and 1 basis point is represented as 0.0001 (Mantissa = 1, Exponent = -4)	8
Percentage9	A decimal fixed-point number with exponent = -9 (used for index instruments). A percentage of 0.4877802% is the number 0.004877802 (Mantissa = 4877802, exponent = -9)	8
NumInGroup	Counter representing the number of entries in a repeating group. Must be positive. Because the messages here can't exceed 1400 bytes, we use a 1-byte counter (from 0 to 255), and 2 bytes for the "block length".	3
Enum	A single choice of mutually exclusive values. Depending on the range of values, it can be represented in 1 or 2 bytes. For instance, the values for the enum representing Side (tag 54) are Buy (1) and Sell (2); for SecurityType (tag 167), are CS(1), PS(2), CASH (3), OPT (4), and so on. The specific values can be found in the SBE Template schema file.	1 or 2
VarString	A variable-length string, encoded in UTF-8	2 + N

### 4.1 Constant Values

Constant values (specified in the template as presence="constant") aren't transmitted, because the values are already specified by the template. The wire size (number of bytes required to transmit the field) is always 0 (zero).

### 4.2 Field Placement and Alignment

The ordering of the fields in this document follows the same order of the fields in the current version of the SBE Template.

The fields for the incremental refresh messages are carefully aligned, according to their data type, to maximize the speed of access. The most important fields are placed in the first 64 bytes of each message (first cache line).

Alignment is especially important for speeding up FPGA processing. It is guaranteed by judicious placement of the fields, and padding. (In SBE the alignment and padding are done by specifying the field offsets explicitly (see more information at <https://www.fixtrading.org/standards/sbe-online/#message-body>), and by carefully defining the block length of the message (block length must be greater than or equal to the sum of the sizes of all fields in the message or group: see more detail of padding at the end of a message at <https://www.fixtrading.org/standards/sbe-online/#padding-at-end-of-a-message-or-group>). There are no ‘dummy fields’ for padding; the unused space can be reclaimed by a specification update). We highlighted field offsets and block lengths that are different than the sum of size of the fields in the Message Reference document for clarification.

There are fields that can be found in most incremental messages, so they are placed in the same offset if possible.

Examples:

Offset	Field	Trade	Order	ClosingPrice	QuantityBand
0	SecurityID	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
8	MatchEventIndicator	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

## 4.3 Common Type Mappings

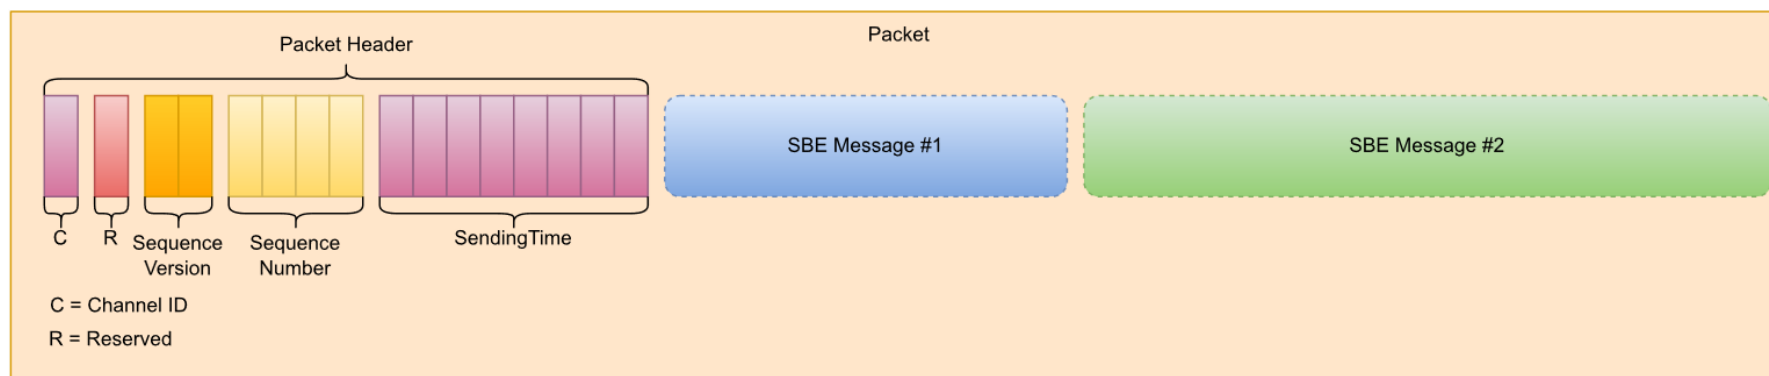

UMDF FIX/FAST	UMDF SBE	Reason	Example
UTCDateOnly and UTCTimeOnly	UTCTimestampNanos	Remove expensive conversions from decimal formats in Market Data; add nanosecond precision	Field MDEntryDate (tag 273) and MDEntryTime (274) were combined and mapped to MDEntryTimestamp (37033)
FIX MultipleValueString	Set	Save space (each alternative is represented by one bit). Validate the domain	Field TradeCondition (tag 277)
String or Integer fields with a limited domain	Enum	Save space (no unlimited reserved space)  Validate the domain.	Field MDUpdateAction

## 5 HEADERS

### 5.1 Packet Header

Each packet (datagram) has one **Packet Header**, and one or more messages inside.

The packet header is in *little-endian* format (the least significant values come first). The total size is 16 bytes.

Packet Header has the following fields:

Name	Type	Size (bytes)	Description
<b>ChannelID</b>	uint8	1	Channel ID
<b>Reserved</b>	uint8	1	Reserved.
<b>SequenceVersion</b>	uint16	2	Packet Sequence Version. Starts with 1 every week, incremented in case of failover events.
<b>SequenceNumber</b>	uint32	4	Packet Sequence Number.
<b>SendingTime</b>	uint64	8	UTC date and time of message transmission, in nanoseconds since Unix epoch (Jan 1 <sup>st</sup> , 1970), accurate to microseconds.

## 5.2 Message Header

Each message in the packet starts with a *Message Header* that consists of the *Framing Header* and the **SBE Message Header**.

The message header is in little-endian format (the least significant values come first). The total size is 12 bytes.

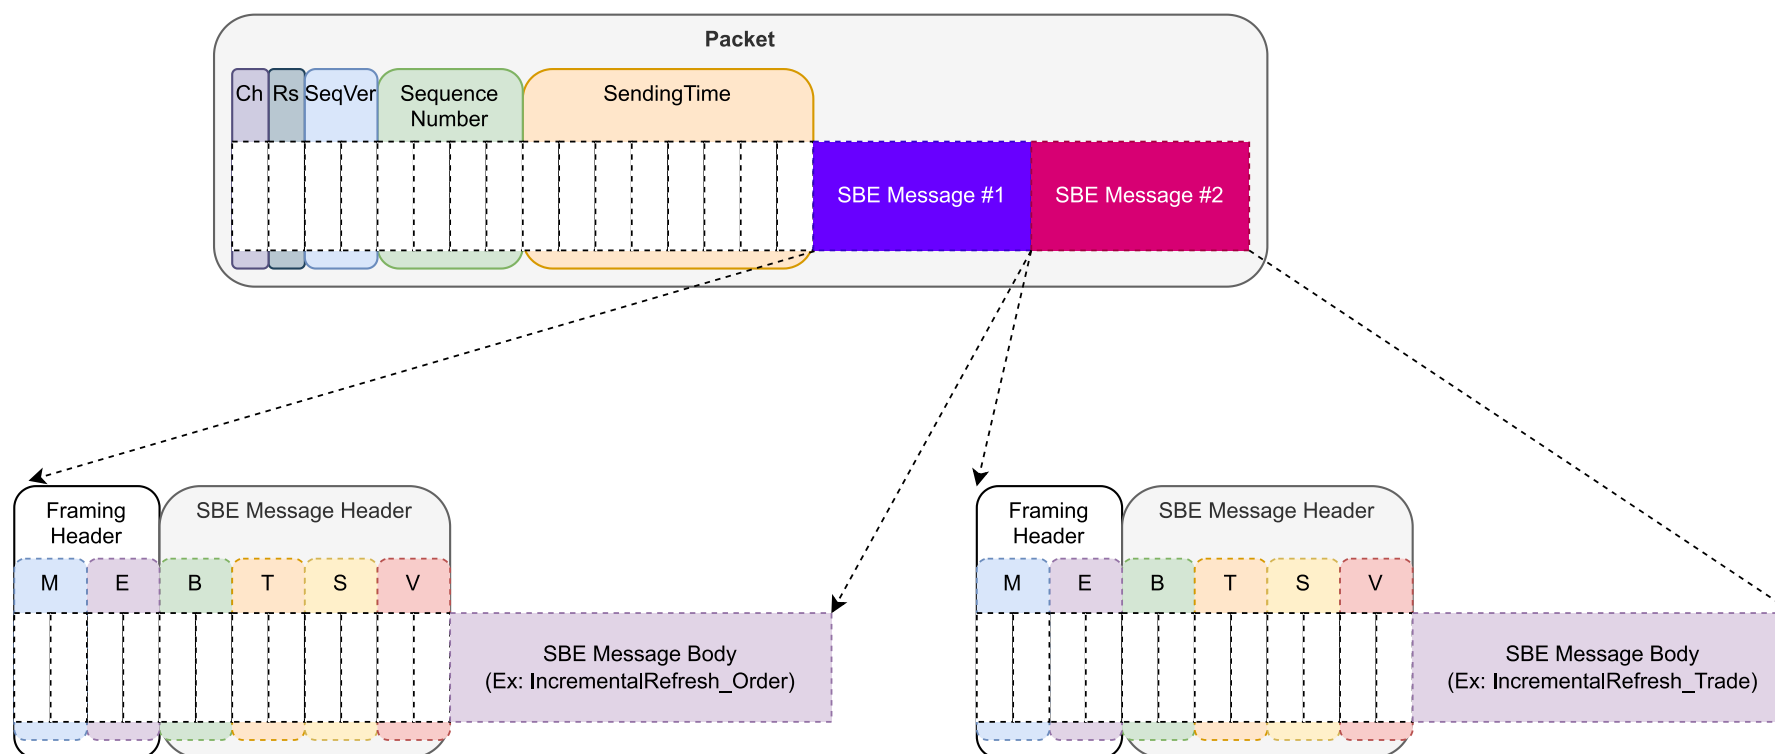

Message Header has the following fields:

Name	Type	Size (bytes)	Description
<b>(Framing Header)</b>			
<b>MessageLength</b>	uint16	2	Overall message length including headers to support framing.
<b>EncodingType</b>	uint16	2	Identifier of the encoding used in the message payload (always "50 EB – SBE 1.0 Little-Endian)
<b>(SBE Message Header)</b>			
<b>BlockLength</b>	uint16	2	The total space reserved for the root level of the message not counting any repeating groups or variable-length fields.
<b>TemplateID</b>	uint16	2	Identifier of the message template.
<b>SchemaID</b>	uint16	2	Identifier of the message schema that contains the template.
<b>SchemaVersion</b>	uint16	2	The version of the message schema in which the message is defined.

## 6 SAMPLE PACKET

A packet with two SBE messages is shown below.

# Market Data B3: Binary UMDf

MESSAGE REFERENCE – VERSION 2.1.0

This is the binary representation of a packet containing two SBE messages.

	0	1	2	3	4	5	6	7	8	9	a	b	c	d	e	f

## Legend:

**Packet Header** – 16-byte header for each packet.

**Framing Header** – 4-byte header for each SBE message.

**SBE Message Header** – 8-byte header for each SBE Body.

### 6.1.1 Packet Header

Offset	Length	Field	Hex bytes	Decoded value
0000	1	ChannelID	37	55 (Channel #55)
0001	1	Reserved	00	-
0002	2	SequenceVersion	01 00	1
0004	4	SequenceNumber	b1 68 de 3a	0x3ade68b1 = 987654321
0008	8	SendingTime	00 c8 98 65 f4 ac eb 15	0x15ebacf46598c800 = 1579546260000000000 = Jan 20, 2020 18:51:00.000000000

### 6.1.2 Framing Header #1

Offset	Length	Field	Hex bytes	Decoded value
0010	2	MessageLength	4C 00	0x004C = 76
0012	2	EncodingType	50 eb	SBE 1.0 Little-Endian

### 6.1.3 SBE Message Header #1

Offset	Length	Field	Hex bytes	Decoded value
0014	2	BlockSize	40 00	0x0040 = 64
0016	2	TemplateID	32 00	0x0032 = 50 (Order_50)
0018	2	SchemaID	02 00	0x0002 = 2
001A	2	SchemaVersion	0F 00	0x000F = 15
001C ... 0053	72	SBE Message Body	a4 92 78...	

### 6.1.4 Framing Header #2

Offset	Length	Field	Hex bytes	Decoded value
0058	2	MsgLength	44 00	0x0044 = 68
005a	2	Encoding	50 eb	SBE 1.0 Little-Endian

## 6.1.5 SBE Message Header #2

Offset	Length	Field	Hex bytes	Decoded value
005C	2	BlockSize	38 00	0x0038 = 56
005E	2	TemplateID	35 00	0x0035 = 53 (Trade_53)
0060	2	SchemaID	02 00	0x0002 = 2
0062	2	SchemaVersion	0F 00	0x000F = 15
0064 ... 009F	56	SBE Message Body	a4 92 78...	

## 7 SBE APPLICATION MESSAGES

### 7.1 Template

Name	Description	Semantic Version	Schema Version	Package	Byte Order
b3-market-data-messages.xml	SBE Template for Market Data Messages	2.1.0	15	b3.umdf.mbo.sbe	Little Endian

## 8 TYPES

Name	Data Type	Size	Description
Asset	char	6	Asset associated with the security, such as DOL, BGI, OZ1, WDL, CNI, etc.
blockLength	uint16	2	Root block length.
CFIcode	char	6	Classification of Financial Instruments (CFI code) values, which indicate the type of security using the ISO 10962 standard.
channelNumber	uint8	1	Channel number.
ClearingHouseID	uint64	8	ClearingHouseID (SecurityAltID).
CountryCode	char	2	ISO 3166-1 alpha-2 country code.
Currency	char	3	3-letter alphabetic ISO Currency Codes (ISO 4217). Example: BRL, USD.
day	uint8	1	Day of month (1 to 31)
encodingType	uint16	2	Identifier of the encoding used in the message payload.
exponent	int8	0	Exponent (for fixed-point decimal numbers).
FirmOptional	uint32	4	Identifies the broker firm.
ISINNumber	char	12	ISIN Number (SecurityAltID).
LanguageCode	char	2	ISO 639-1 two-letter language code.
length	uint16	2	Length of a string, in bytes. For instance, the string 'Ação', converted to UTF-8, has 6 bytes, so length = 6.
LocalMktDate	uint16	2	Local date (as opposed to UTC). Number of days since UNIX Epoch (January 1st, 1970). Example: 18319 represents February 27, 2020.
LocalMktDateOptional	uint16	2	Optional local date (as opposed to UTC). Number of days since UNIX Epoch (January 1st, 1970). Example: 18319 represents February 27, 2020.
LocalMktDate32	int32	4	Local date (as opposed to UTC). Number of days since UNIX Epoch (January 1st, 1970). Example: 18319 represents February 27, 2020.

# Market Data B3: Binary UMDF

MESSAGE REFERENCE – VERSION 2.1.0

Name	Data Type	Size	Description
LocalMktDate32Optional	int32	4	Optional local date (as opposed to UTC). Number of days since UNIX Epoch (January 1st, 1970). Example: 18319 represents February 27, 2020.
mantissa	int64	8	Mantissa (for fixed-point decimal numbers).
MarketSegmentID	uint8	1	Identifies the market segment. Required for all tradable instruments. Not present in equity indexes, ETF indexes, BTB and Option Exercise.
MDEntryPositionNo	uint32	4	<b>[DEPRECATED]</b> - Display position of a bid or offer, numbered from most competitive to least competitive, per market side, beginning with 1. Deprecated since schema version 15.
messageLength	uint16	2	Overall message length including headers to support framing.
month	uint8	1	Month (1 to 12)
NewsID	uint64	8	News ID.
NumberOfTrades	uint32	4	Contains the number of trades executed in the session.
numInGroup	uint8	1	A counter representing the number of entries in a repeating group.
OrderID	uint64	8	Unique identifier for Order as assigned by the exchange.
packetLength	uint16	2	Packet Length.
Quantity	int64	8	Quantity in order/trade.
QuantityOptional	int64	8	Optional quantity in order/trade.
QuantityVolume	int64	8	Volume Quantity.
QuantityVolumeOptional	int64	8	Optional volume quantity.
reserved	uint8	1	Reserved.
RptSeq	uint32	4	Sequence number per instrument update. It can be used to synchronize the snapshot with the incremental feed if the client is only interested in a subset of the channel's instruments.
SecurityExchange	char	4	Security Exchange Code.
SecurityExchangeBVMF	char	0	SecurityExchange (constant BVMF).
SecurityGroup	char	3	Indicates the group this instrument belongs to.
SecurityID	uint64	8	Security ID as defined by B3's Trading System.
SecurityIDOptional	uint64	8	Optional Security ID as defined by B3's Trading System.
SecurityStrategyType	char	3	Strategy type definition. Required for strategy instruments.

# Market Data B3: Binary UMDF

## MESSAGE REFERENCE – VERSION 2.1.0

Name	Data Type	Size	Description
sendingTime	uint64	8	Sending Time as number of nanoseconds since epoch (1970-01-01 00:00:00 UTC).
SeqNum	uint32	4	Sequence number inside the given channel.
SeqNum1	uint32	0	Sequence Number, fixed to 1.
sequenceNumber	uint32	4	Packet sequence number (reset to 1 when sequenceVersion increments).
sequenceVersion	uint16	2	Sequence version (incremented weekly or when market data engine failover happens).
SettlType	uint16	2	Indicates order settlement period in days. (e.g. 0, D1, D2, D3, D60, D120 etc). If present, SettlDate (64) overrides this field.
Symbol	char	20	Ticker symbol.
time	uint64	8	UTC timestamp with nanosecond precision (Unix Epoch).
TradeID	uint32	4	Contains the unique identifier for this trade per instrument + trading date, as assigned by the exchange. Required if reporting a Trade.
UInt16	uint16	2	2-byte unsigned integer, from 0 to 65535.
UInt16NULL	uint16	2	2-byte unsigned integer, from 1 to 65535, NULL (optional) value = 0.
UInt32	uint32	4	4-byte unsigned integer, from 0 to 4294967295 (2 <sup>32</sup> -1).
UInt32NULL	uint32	4	4-byte unsigned integer, from 1 to 4294967295 (2 <sup>32</sup> -1), NULL (optional) value = 0.
UInt64NULL	uint64	8	8-byte unsigned integer, from 1 to 18446744073709551615 (2 <sup>64</sup> -1), NULL (optional) value = 0.
UInt8	uint8	1	1-byte unsigned integer, from 0 to 255.
UInt8NULL	uint8	1	1-byte signed integer, from -128 to 127, NULL (optional) value = 0.
unit	uint8	0	time unit (nanoseconds).
varData	uint8	N	Bytes of the string, encoded in UTF-8.
week	uint8	1	Week of month (1 to 5).
year	uint16	2	4-digit year.

## 9.2 Message Definitions

All messages are summarized below:

**Presence** of the field in the message can be:

- **R** = required.
- **O** = optional (if it is not present, assume the null value defined in the related type or, if not explicitly defined it is the default null value of the primitive type. See [optional fields and default values](#) section).
- **C** = constant.

### 9.2.1 Message: SequenceReset\_1

Name	Template ID	Version	Encoded Length	Description
SequenceReset_1	1	15	0	Used to reset the incremental stream or indicate the loop on instrument definition or snapshot recovery is restarting

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
35	messageType	C	MessageType Enum (char)		Constant: "4" (Sequence Reset).
1128	applVerID	C	ApplVerID Enum (uint8)		Specifies the service pack release being applied at message level. Constant: 9 (FIX 5.0 SP2).
36	newSeqNo	C	SeqNum1 (uint32)		New sequence number. Always one. Constant: 1

### 9.2.2 Message: Sequence\_2

Name	Template ID	Version	Encoded Length	Description
Sequence_2	2	15	4	Sent in incremental, snapshot and instrument list feeds in periods of no activity.

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
35	messageType	C	MessageType Enum (char)		Constant: "0" (Sequence message for heartbeat).
1128	applVerID	C	ApplVerID Enum (uint8)		Specifies the service pack release being applied at message level. Constant: 9 (FIX 5.0 SP2).
35526	nextSeqNo	R	SeqNum (uint32)	0 (4)	The next application sequence number in the feed. Always 1 (one) for snapshot replay and instrument replay feeds.

### 9.2.3 Message: SecurityStatus\_3

Name	Template ID	Version	Encoded Length	Description
SecurityStatus_3	3	15	36	Trading status for instruments

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
35	messageType	C	MessageType Enum (char)		Constant: "f" (Security Status).
1128	applVerID	C	ApplVerID Enum (uint8)		Specifies the service pack release being applied at message level. Constant: 9 (FIX 5.0 SP2).
48	securityID	R	SecurityID (uint64)	0 (8)	Security ID as defined by B3. For the SecurityID list, see the Security Definition message in Market Data feed.
22	securityIDSource	C	SecurityIDSource Enum (char)		Identifies the class of the SecurityID. Constant: "EXCHANGE_SYMBOL" (8).
207	securityExchange	C	SecurityExchangeBVMF (char)		Market to which the symbol belongs. Constant: "BVMF"

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
37035	matchEventIndicator	R	MatchEventIndicator Set (uint8)	8 (1)	Set of indicators that identify some market data events. Here are the possible bits applied to this message when it is set: Bit 7: Last message for the event.
336	tradingSessionID	R	TradingSessionID Enum (uint8)	9 (1)	Identifier for trading session.
326	securityTradingStatus	R	SecurityTradingStatus Enum (uint8)	10 (1)	Status related to a given instrument.
1174	securityTradingEvent	O	SecurityTradingEvent Enum (uint8)	11 (1)	Identifies an event related to a Trading. This tag is also used to mark when an instrument state is kept separate from the group phase, or when the instrument state follows the default group phase (stops having a separate, defined state). Always sent when tag 48 is present.
75	tradeDate	R	LocalMktDate (uint16)	12 (2)	Used to specify the trading date for which a set of market data applies.
	<padding>			14 (2)	*
342	tradSesOpenTime	O	UTCTimestampNanos	16 (8)	Estimated end of the current auction. Only present when SecurityTradingStatus=21 (Pre-open/Reserved).
60	transactTime	R	UTCTimestampNanos	24 (8)	Timestamp when status of the security changed.

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
83	rptSeq	O	RptSeq (uint32)	32 (4)	Sequence number per instrument update. (Zeroed in snapshot feed)

\* Padding is implemented by declaring "offset" attribute in next field.

### 9.2.4 Message: News\_5

Name	Template ID	Version	Encoded Length	Description
News_5	5	15	42 + N	Conveys market information of B3 market surveillance notifications and news produced by agencies.

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
35	messageType	C	MessageType Enum (char)		Constant: "B" (News).
1128	applVerID	C	ApplVerID Enum (uint8)		Specifies the service pack release being applied at message level. Constant: 9 (FIX 5.0 SP2).
48	securityID	O	SecurityIDOptional (uint64)	0 (8)	Security ID as defined by B3. For the SecurityID list, see the Security Definition message in Market Data feed.

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
22	securityIDSource	C	SecurityIDSource Enum (char)		Identifies the class of the SecurityID. Constant: "EXCHANGE_SYMBOL" (8).
207	securityExchange	C	SecurityExchangeBVMF (char)		Market to which the symbol belongs. Constant: "BVMF"
37035	matchEventIndicator	R	MatchEventIndicator Set (uint8)	8 (1)	Set of indicators that identify some market data events. Here are the possible bits applied to this message when it is set: Bit 7: Last message for the event.
6940	newsSource	R	NewsSource Enum (uint8)	9 (1)	Source of the News.
1474	languageCode	O	LanguageCode (char)	10 (2)	Indicates the language the news is in. If null, it's 'pt' = Portuguese.
37709	partCount	R	UInt16 (uint16)	12 (2)	Total number of parts for the text of a News message. Usually 1.
37710	partNumber	R	UInt16 (uint16)	14 (2)	Number of the part for this message. Starts from 1.
1472	newsID	O	NewsID (uint64)	16 (8)	Unique identifier for News message. Included in the News messages sent in the Unified News Channel. Not sent for trading engine News messages.

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
42	origTime	O	UTCTimestampNanos	24 (8)	Time of message origination.
37777	totalTextLength	R	UInt32 (uint32)	32 (4)	Total size, in bytes, for the text of a News message.
148	headline	R	VarString	2 + N	The headline of a News message.
58	text	R	VarString	2 + N	Free format text string.
149	uRLLink	R	VarString	2 + N	A URL (Uniform Resource Locator) link to additional information (e.g. <a href="http://www.b3.com.br">http://www.b3.com.br</a> ).

### 9.2.5 Message: EmptyBook\_9

Name	Template ID	Version	Encoded Length	Description
EmptyBook_9	9	15	20	Market Data Incremental Refresh - Empty Book

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
35	messageType	C	MessageType Enum (char)		Constant: "X" (Market Data Incremental Refresh).
1128	applVerID	C	ApplVerID Enum (uint8)		Specifies the service pack release being applied at message level. Constant: 9 (FIX 5.0 SP2).
279	mDUpdateAction	C	MDUpdateAction Enum (uint8)		Update Action (NEW) - always replace. Constant: 0 (New).
269	mDEntryType	C	MDEntryType Enum (char)		Constant: "J" (Empty Book).
48	securityID	R	SecurityID (uint64)	0 (8)	Security ID as defined by B3. For the SecurityID list, see the Security Definition message in Market Data feed.

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
22	securityIDSource	C	SecurityIDSource Enum (char)		Identifies the class of the SecurityID. Constant: "EXCHANGE_SYMBOL" (8).
207	securityExchange	C	SecurityExchangeBVMF (char)		Market to which the symbol belongs. Constant: "BVMF"
37035	matchEventIndicator	R	MatchEventIndicator Set (uint8)	8 (1)	Set of indicators that identify some market data events. Here are the possible bits applied to this message when it is set: Bit 5: Message is sent during recovery process. Bit 7: Last message for the event.
	<padding>			9 (3)	*
37033	mDEntryTimestamp	R	UTCTimestampNanos	12 (8)	Date and time of market data entry.

\* Padding is implemented by declaring "offset" attribute in next field.

### 9.2.6 Message: SecurityGroupPhase\_10

Name	Template ID	Version	Encoded Length	Description
SecurityGroupPhase_10	10	15	32	Trading status for security groups

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
35	messageType	C	MessageType Enum (char)		Constant: "f" (Security Status).
1128	applVerID	C	ApplVerID Enum (uint8)		Specifies the service pack release being applied at message level. Constant: 9 (FIX 5.0 SP2).
1151	securityGroup	R	SecurityGroup (char)	0 (3)	Security Group.
	<padding>			3 (5)	*
37035	matchEventIndicator	R	MatchEventIndicator Set (uint8)	8 (1)	Set of indicators that identify some market data events. Here are the possible bits applied to this message when it is set: Bit 7: Last message for the event.
336	tradingSessionID	R	TradingSessionID Enum (uint8)	9 (1)	Identifier for trading session.

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
625	tradingSessionSubID	R	TradingSessionSubID Enum (uint8)	10 (1)	Phase related to a given SecurityGroup.
1174	securityTradingEvent	O	SecurityTradingEvent Enum (uint8)	11 (1)	Indicates if the trading session changed in order to reset some statistics for this group.
75	tradeDate	R	LocalMktDate (uint16)	12 (2)	Used to specify the trading date for which a set of market data applies.
	<padding>			14 (2)	*
342	tradSesOpenTime	O	UTCTimestampNanos	16 (8)	Estimated end of the current auction. Only present when TradingSessionSubID=21 (Pre-open/Reserved).
60	transactTime	R	UTCTimestampNanos	24 (8)	Timestamp when phase of the security group changed.

\* Padding is implemented by declaring "offset" attribute in next field.

### 9.2.7 Message: ChannelReset\_11

Name	Template ID	Version	Encoded Length	Description
ChannelReset_11	11	15	12	Channel Reset (remove all instruments, empty all books and statistics)

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
35	messageType	C	MessageType Enum (char)		Constant: "X" (Market Data Incremental Refresh).
1128	applVerID	C	ApplVerID Enum (uint8)		Specifies the service pack release being applied at message level. Constant: 9 (FIX 5.0 SP2).
279	mDUpdateAction	C	MDUpdateAction Enum (uint8)		Update Action (NEW) - always replace. Constant: 0 (New).
269	mDEntryType	C	MDEntryType Enum (char)		Constant: "J" (Empty Book).
37035	matchEventIndicator	R	MatchEventIndicator Set (uint8)	0 (1)	Set of indicators that identify some market data events. Here are the possible bits applied to this message when it is set: Bit 5: Message is sent during recovery process. Bit 7: Last message for the event.

37033	mDEntryTimestamp	R	UTCTimestampNanos	4 (8)	Date and time of market data entry.

\* Padding is implemented by declaring "offset" attribute in next field.

## 9.2.8 Message: SecurityDefinition\_12

Name	Template ID	Version	Encoded Length	Description
SecurityDefinition_12	12	15	240 + N	Security Definition.

	Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
	35	messageType	C	MessageType Enum (char)		Constant: "d" (Security Definition).
	1128	applVerID	C	ApplVerID Enum (uint8)		Specifies the service pack release being applied at message level. Constant: 9 (FIX 5.0 SP2).
	48	securityID	R	SecurityID (uint64)	0 (8)	Security ID as defined by B3.
	207	securityExchange	R	SecurityExchange (char)	8 (4)	Exchange Code.
	22	securityIDSource	R	SecurityIDSource (char)	12 (1)	Identifies the class of the SecurityID.

	Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
	1151	securityGroup	R	SecurityGroup (char)	13 (3)	Security Group.
	55	symbol	R	Symbol (char)	16 (20)	Instrument's ticker symbol.
	980	securityUpdateAction	R	SecurityUpdateAction Enum (char)	36 (1)	Action used when updating the security.
	167	securityType	R	SecurityType Enum (uint8)	37 (1)	Instrument's security type.
	762	securitySubType	R	UInt16 (uint16)	38 (2)	Instrument's security sub type. Updated list of values defined at <a href="#">SecuritySubType</a> Enum.
	393	totNoRelatedSym	R	UInt32 (uint32)	40 (4)	Total number of instruments to be returned in the current replay loop.
	969	minPriceIncrement	O	Fixed8 (int64)	44 (8)	Number of minimum price increments.
	202	strikePrice	O	PriceOptional (int64)	52 (8)	Strike price of an option.

	Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
	231	contractMultiplier	O	Fixed8 (int64)	60 (8)	Specifies the ratio or multiply factor to convert from “nominal” units (e.g. contracts) to total units (e.g. shares) (e.g. 1.0, 100, 1000, 0.00025 etc).
	37012	priceDivisor	O	Fixed8 (int64)	68 (8)	Value that divides the Price field to produce the actual order price (based on Step of Quotation). (e.g. 1, 100, 1000, etc). Default value is 1. Also used for index instruments to disseminate the index reducer, in this case, there is no default value.
	6938	securityValidityTimestamp	R	UTCTimestampSeconds	76 (8)	Indicates the UTC timestamp when trading for this security expires, i.e. when it is not eligible to trade anymore. Different from MaturityDate.
	7595	noSharesIssued	O	UInt64NULL (uint64)	84 (8)	Share capital.
	37037	clearingHouseID	O	ClearingHouseID (uint64)	92 (8)	Clearing House ID.
	9749	minOrderQty	O	QuantityOptional (int64)	100 (8)	Minimum quantity for an order.
	9748	maxOrderQty	O	QuantityOptional (int64)	108 (8)	Maximum quantity for an order.

	Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
	1231	minLotSize	O	QuantityOptional (int64)	116 (8)	Minimum lot size allowed based on lot type specified in LotType(1093). Used for the equities segment.
	562	minTradeVol	O	QuantityOptional (int64)	124 (8)	The minimum trading volume for the security.
	37010	corporateActionEventId	O	UInt32NULL (uint32)	132 (4)	Corporate Action Event ID.
	225	issueDate	R	LocalMktDate32 (int32)	136 (4)	The date on which the security is issued/activated.
	541	maturityDate	O	LocalMktDate32Optional (int32)	140 (4)	Date of instrument maturity.
	470	countryOfIssue	O	CountryCode (char)	144 (2)	ISO 3166-1 alpha-2 country code.
	916	startDate	O	LocalMktDate32Optional (int32)	146 (4)	Start date of a financing deal, i.e. the date the buyer pays the seller cash and takes control of the collateral.
	917	endDate	O	LocalMktDate32Optional (int32)	150 (4)	End date of a financing deal, i.e. the date the seller reimburses the buyer and takes back control of the collateral.

	Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
	63	settlType	O	SettlType (uint16)	154 (2)	Order settlement period in days.
	64	settlDate	O	LocalMktDate32Optional (int32)	156 (4)	Specific date of trade settlement.
	873	datedDate	O	LocalMktDate32Optional (int32)	160 (4)	The date of the security activation, if different from the IssueDate.
	37026	isinNumber	O	ISINNumber (char)	164 (12)	ISIN Number.
	6937	asset	R	Asset (char)	176 (6)	Asset associated to the security.
	461	cfiCode	R	CFICode (char)	182 (6)	Classification of Financial Instruments (CFI code) values, which indicate the type of security using the ISO 10962 standard.
	200	maturityMonthYear	O	MaturityMonthYear	188 (5)	Week, month and year of the maturity (used for standardized futures and options).
	667	contractSettlMonth	O	MaturityMonthYear	193 (5)	Specifies when the contract will settle.

289	mDEntrySeller	O	FirmOptional (uint32)	36 (4)	For reporting trades (selling party).
75	tradeDate	R	LocalMktDate (uint16)	40 (2)	Used to specify the trading date for which a set of market data applies.
829	trdSubType	O	TrdSubType Enum (uint8)	42 (1)	Sub type of trade assigned to a trade. <u>Since schema version 7.</u>
	<padding>			43 (1)	*
60	transactTime	R	UTCTimestampNanos	44 (8)	Timestamp when the trade event occurred in the matching process.
83	rptSeq	O	RptSeq (uint32)	52 (4)	Sequence number per instrument update. Zeroed in snapshot feed.

\* Padding is implemented by declaring "offset" attribute in next field.

9.2.24 Message: ForwardTrade\_54

Name	Template ID	Version	Encoded Length	Description
ForwardTrade_54	54	15	68	Relays trade information on one Forward instrument

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
35	messageType	C	MessageType Enum (char)		Constant: "X" (Market Data Incremental Refresh).
1128	applVerID	C	ApplVerID Enum (uint8)		Specifies the service pack release being applied at message level. Constant: 9 (FIX 5.0 SP2).
48	securityID	R	SecurityID (uint64)	0 (8)	Security ID as defined by B3. For the SecurityID list, see the Security Definition message in Market Data feed.
22	securityIDSource	C	SecurityIDSource Enum (char)		Identifies the class of the SecurityID. Constant: "EXCHANGE_SYMBOL" (8).
207	securityExchange	C	SecurityExchangeBVMF (char)		Market to which the symbol belongs. Constant: "BVMF"

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
37035	matchEventIndicator	R	MatchEventIndicator Set (uint8)	8 (1)	Set of indicators that identify some market data events. Here are the possible bits applied to this message when it is set: Bit 7: Last message for the event.
279	mDUpdateAction	C	MDUpdateAction Enum (uint8)		Update Action (NEW). Constant: 0 (New).
269	mDEntryType	C	MDEntryType Enum (char)		Entry type: Trade. Constant: "2" (Trade or Trade Summary or Last Trade Price).
336	tradingSessionID	R	TradingSessionID Enum (uint8)	9 (1)	Identifier for trading session.
277	tradeCondition	R	TradeCondition Set (uint16)	10 (2)	Set of conditions describing a trade.
270	mDEntryPx	R	Price	12 (8)	Price of the Market Data Entry.
271	mDEntrySize	R	Quantity (int64)	20 (8)	Quantity or volume represented by the Market Data Entry.
1003	tradeID	R	TradeID (uint32)	28 (4)	Contains the unique identifier for this trade per instrument + trading date, as assigned by the exchange. Required if reporting a Trade.

9.2.28 Message: SnapshotFullRefresh\_Header\_30

Name	Template ID	Version	Encoded Length	Description
SnapshotFullRefresh_Header_30	30	15	34	Header for the snapshot of a single instrument

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
35	messageType	C	MessageType Enum (char)		Constant: "W" (Market Data Full Refresh).
1128	applVerID	C	ApplVerID Enum (uint8)		Specifies the service pack release being applied at message level. Constant: 9 (FIX 5.0 SP2).
48	securityID	R	SecurityID (uint64)	0 (8)	Security ID as defined by B3. For the SecurityID list, see the Security Definition message in Market Data feed.
22	securityIDSource	C	SecurityIDSource Enum (char)		Identifies the class of the SecurityID. Constant: "EXCHANGE_SYMBOL" (8).
207	securityExchange	C	SecurityExchangeBVMF (char)		Market to which the symbol belongs. Constant: "BVMF"

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
369	lastMsgSeqNumProcessed	R	SeqNum (uint32)	8 (4)	The last processed packet sequence number of the incremental channel as of the time the snapshot was generated. This value is used to synchronize the snapshot with the incremental feed.
911	totNumReports	R	UInt32 (uint32)	12 (4)	Total number of snapshots to be returned in the current replay loop.
37071	totNumBids	R	UInt32 (uint32)	16 (4)	Total number of bid orders that constitute this snapshot.
37072	totNumOffers	R	UInt32 (uint32)	20 (4)	Total number of ask orders that constitute this snapshot.
37070	totNumStats	R	UInt16 (uint16)	24 (2)	Total number of statistics (incremental and security status messages) that constitute this snapshot.
	<padding>			26 (2)	*
37083	lastRptSeq	O	RptSeq (uint32)	28 (4)	Last processed RptSeq (sequence number per instrument update) for this instrument. Can be used to synchronize the snapshot with the incremental feed if the client is only interested in a subset of the channel's instruments.

Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
37084	lastSequenceVersion	O	UInt16NULL (uint16)	32 (2)	<b>[NEW]</b> The last processed packet sequence version of the incremental channel as of the time the snapshot was generated. This value is used to synchronize the snapshot with the incremental feed. <u>Since schema version 15.</u>

\* Padding is implemented by declaring "offset" attribute in next field.

### 9.2.29 Message: SnapshotFullRefresh\_Orders\_MBO\_71

Name	Template ID	Version	Encoded Length	Description
SnapshotFullRefresh_Orders_MBO_71	71	15	11 + N	Partial list of orders for the snapshot of a single instrument.

	Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
	35	messageType	C	MessageType Enum (char)		Constant: "W" (Market Data Full Refresh).
	1128	applVerID	C	ApplVerID Enum (uint8)		Specifies the service pack release being applied at message level. Constant: 9 (FIX 5.0 SP2).

	Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
	48	securityID	R	SecurityID (uint64)	0 (8)	Security ID as defined by B3. For the SecurityID list, see the Security Definition message in Market Data feed.
	22	securityIDSource	C	SecurityIDSource Enum (char)		Identifies the class of the SecurityID. Constant: "EXCHANGE_SYMBOL" (8).
	207	securityExchange	C	SecurityExchangeBVMF (char)		Market to which the symbol belongs. Constant: "BVMF"
	268	<b>noMDEntries</b>	R	GroupSizeEncoding	8 (42)	Partial list of orders.
→	270	mDEntryPx	O	PriceOptional	0 (8)	Price per share or contract. Conditionally required if the order type requires a price (not market orders).
→	271	mDEntrySize	R	Quantity (int64)	8 (8)	Displayed quantity or volume represented by the Market Data Entry.
→	290	mDEntryPositionNo	O	MDEntryPositionNo (uint32)	16 (4)	<b>[DEPRECATED]</b> - Display position of a bid or offer, numbered from most competitive to least competitive, per market side, beginning with 1. Deprecated since schema version 15.
→	37501	enteringFirm	O	FirmOptional (uint32)	20 (4)	Identifies the broker firm.

	Tag	Tag Name	Presence	Data Type (Primitive Type)	Offset (Size)	Comments
→	37034	mDInsertTimestamp	R	UTCTimestampNanos	24 (8)	The date and time when the order was inserted or re-inserted into the order book or manually altered by MktOps.
→	198	secondaryOrderID	R	OrderID (uint64)	32 (8)	Exchange-generated identifier of the order that updates with each order modification event involving a loss of priority, price change, or quantity replenishment in disclosed orders. This identifier reflects the order's priority relative to other orders at the same price-level in an ascending manner, where smaller values indicate higher priority.
→	269	mDEntryType	R	MDEntryType Enum (char)	40 (1)	Entry Type (BID or OFFER).
→	37035	matchEventIndicator	O	MatchEventIndicator Set (uint8)	41 (1)	Set of indicators that identify some market data events. Here are the possible bits applied to this message when it is set: Bit 4: Implied generated order. <u>Since schema version 10.</u>

## 10 COMPOSITE TYPES

### 10.1 Type: Fixed8

Name	Version	Encoded Length	Description
------	---------	----------------	-------------

Fixed8	15	8	Decimal with constant exponent -8.
--------	----	---	------------------------------------

Name	Data Type	Size	Offset	Description
mantissa	int64	8	0	Mantissa (for fixed-point decimal numbers).
exponent	int8	0	8	Exponent (for fixed-point decimal numbers). Constant: -8

### 10.2 Type: FramingHeader

Name	Version	Encoded Length	Description
FramingHeader	15	4	Framing Header (Compact SOFH).

Name	Data Type	Size	Offset	Description
messageLength	uint16	2	0	Overall message length including headers to support framing.
encodingType	uint16	2	2	Identifier of the encoding used in the message payload.

### 10.3 Type: GroupSizeEncoding

Name	Version	Encoded Length	Description
GroupSizeEncoding	15	3	Repeating group dimensions.

Name	Data Type	Size	Offset	Description
blockLength	uint16	2	0	Root block length.
numInGroup	uint8	1	2	A counter representing the number of entries in a repeating group.

### 10.4 Type: MaturityMonthYear

Name	Version	Encoded Length	Description
MaturityMonthYear	15	5	Week, month and year of the maturity (used for standardized futures and options).

Name	Data Type	Size	Offset	Description
------	-----------	------	--------	-------------

year	uint16	2	0	4-digit year
month	uint8	1	2	Month (1 to 12)
day	uint8	1	3	Day of month (1 to 31)
week	uint8	1	4	Week of month (1 to 5)

### 10.5 Type: messageHeader

Name	Version	Encoded Length	Description
messageHeader	15	9	Message identifiers and length of message root.

Name	Data Type	Size	Offset	Description
blockLength	uint16	2	0	Root block length.
templateId	uint16	2	2	Template ID.
schemald	uint16	2	4	Schema ID.
version	uint16	2	6	Schema Version.

### 10.6 Type: PacketHeader

Name	Version	Encoded Length	Description
PacketHeader	15	16	Packet header.

Name	Data Type	Size	Offset	Description
channelNumber	uint8	1	0	Channel number.
reserved	uint8	1	1	Reserved.
sequenceVersion	uint16	2	2	Sequence version (incremented weekly or when market data engine failover happens).
sequenceNumber	uint32	4	4	Packet sequence number (reset to 1 when sequenceVersion increments).
sendingTime	uint64	8	8	Sending Time as number of nanoseconds since epoch (1970-01-01 00:00:00 UTC).

### 10.7 Type: Percentage

Name	Version	Encoded Length	Description
Percentage	15	8	Percentage (4 decimal places).

Name	Data Type	Size	Offset	Description
mantissa	int64	8	0	Mantissa (for fixed-point decimal numbers).
exponent	int8	0	8	Exponent (for fixed-point decimal numbers). Constant: -4

### 10.8 Type: Price

Name	Version	Encoded Length	Description
Price	15	8	Price (4 decimal places). Usually 3 places are enough, but FX requires 4.

Name	Data Type	Size	Offset	Description
mantissa	int64	8	0	Mantissa (for fixed-point decimal numbers).
exponent	int8	0	8	Exponent (for fixed-point decimal numbers). Constant: -4

### 10.9 Type: Price8

Name	Version	Encoded Length	Description
Price8	15	8	Price (8 decimal places). For prices subjected to be adjusted from corporate events.

Name	Data Type	Size	Offset	Description
Mantissa	int64	8	0	Mantissa (for fixed-point decimal numbers).
Exponente	int8	0	8	Exponent (for fixed-point decimal numbers). Constant: -8

## 10.10 Type: PriceOffset8Optional

Name	Version	Encoded Length	Description
PriceOffset8Optional	15	8	Price Offset (8 decimal places). Offsets related to prices subjected to be adjusted from corporate events.

Name	Data Type	Size	Offset	Description
mantissa	int64	8	0	Mantissa (for fixed-point decimal numbers).
exponent	int8	0	8	Exponent (for fixed-point decimal numbers). Constant: -8

## 10.11 Type: PriceOptional

Name	Version	Encoded Length	Description
PriceOptional	15	8	Optional Price (4 decimal places). Usually 3 places are enough, but FX requires 4.

Name	Data Type	Size	Offset	Description
mantissa	int64	8	0	Mantissa (for fixed-point decimal numbers).
exponent	int8	0	8	Exponent (for fixed-point decimal numbers). Constant: -4

## 10.12 Type: RatioQty

Name	Version	Encoded Length	Description
RatioQty	15	8	Ratio of quantity relative to the whole thing.

Name	Data Type	Size	Offset	Description
mantissa	int64	8	0	mantissa
exponent	int8	0	8	exponent. Constant: -7

## 10.13 Type: TextEncoding

Name	Version	Encoded Length	Description
TextEncoding	15	N	Variable-length short UTF-8 String.

Name	Data Type	Size	Offset	Description
length	uint8	1	0	
varData	char	N	1	

## 10.14 Type: UTCTimestampNanos

Name	Version	Encoded Length	Description
UTCTimestampNanos	15	8	UTC timestamp with nanosecond precision (Unix Epoch)

Name	Data Type	Size	Offset	Description
time	uint64	8	0	UTC timestamp with nanosecond precision (Unix Epoch).
unit	uint8	0	8	time unit (nanoseconds). Constant: 9

## 10.15 Type: UTCTimestampSeconds

Name	Version	Encoded Length	Description
UTCTimestampSeconds	15	8	UTC timestamp with second precision (Unix Epoch)

Name	Data Type	Size	Offset	Description
time	int64	8	0	UTC timestamp with second precision (Unix Epoch).
unit	uint8	0	8	time unit (seconds). Constant: 0

## 10.16 Type: VarString

Name	Version	Encoded Length	Description
VarString	15	N	Variable-length long UTF-8 String.

Name	Data Type	Size	Offset	Description
length	uint16	2	0	Length of a string, in bytes. For instance, the string 'Ação', converted to UTF-8, has 6 bytes, so length = 6.
varData	uint8	N	2	Bytes of the string, encoded in UTF-8.

## 11 SETS

### 11.1 Set: MatchEventIndicator

Name	Description	Version	Encoding Type	Encoded Length
MatchEventIndicator	Set of indicators that identify some market data events.	15	uint8	1

Name	Bit Number	Description
Reserved	0	0=Reserved for future use.
Reserved	1	0=Reserved for future use.
Reserved	2	0=Reserved for future use.
Reserved	3	0=Reserved for future use.
Implied	4	1=Implied generated order or trade, 0=Not implied. <u>Since schema version 10.</u>
RecoveryMsg	5	1=Message is sent during recovery process (QuoteCondition=R), 0=Not.
Reserved	6	0=Reserved for future use.
EndOfEvent	7	1=Last message for the event, 0=Not last.

## 11.2 Set: TradeCondition

Name	Description	Version	Encoding Type	Encoded Length
TradeCondition	Set of conditions describing a trade.	15	uint16	2

Name	Bit Number	Description
OpeningPrice	0	1=Opening Price (R), 0=Not.
Crossed	1	1=Crossed (X), 0=Not.
LastTradeAtTheSamePrice	2	1=Last Trade at the Same Price (L), 0=Not.
OutOfSequence	3	1=Out of sequence (Not last trade), 0=Last trade.
TradeOnBehalf	6	1=Marketplace Entered Trade (Trade on behalf) (2), 0=Not.
RegularTrade	13	1=Regular Trade, 0=Special trade type (see <i>TrdSubType</i> enum).
BlockTrade	14	1=Block Trade (see <i>TrdSubType</i> enum for details), 0=Not.

## 11.3 Set: ImbalanceCondition

Name	Description	Version	Encoding Type	Encoded Length
ImbalanceCondition	Set of conditions describing a imbalance.	15	uint16	2

Name	Bit Number	Description
ImbalanceMoreBuyers	8	1=Imbalance more buyers (P), 0=Not.
ImbalanceMoreSellers	9	1=Imbalance more sellers (Q), 0=Not.

## 12 ENUMERATIONS

Enum Type	Type	Description / Value Domain
<b>AggressorSide</b>	uint8	Which side is aggressor of this trade. 0 - NO_AGGRESSOR: Trade has no aggressor. 1 - BUY: Buy. 2 - SELL: Sell.
<b>ApplVerID</b>	uint8	Specifies the service pack release being applied at message level. 0 - FIX27: FIX 2.7. 1 - FIX30: FIX 3.0. 2 - FIX40: FIX 4.0. 3 - FIX41: FIX 4.1. 4 - FIX42: FIX 4.2. 5 - FIX43: FIX 4.3. 6 - FIX44: FIX 4.4. 7 - FIX50: FIX 5.0. 8 - FIX50SP1: FIX 5.0 SP1. 9 - FIX50SP2: FIX 5.0 SP2.
<b>Boolean</b>	uint8	Boolean type. 0 - FALSE_VALUE: false, N, 0. 1 - TRUE_VALUE: true, Y, 1.
<b>ExerciseStyle</b>	uint8	Type of exercise of a derivatives security. 0 - EUROPEAN: European. 1 - AMERICAN: American.
<b>GovernanceIndicator</b>	uint8	Corporate governance level indicator. Required for cash equities. 0 - No: Unspecified. 1 - N1: Level 1. 2 - N2: Level 2. 4 - NM: New Market. 5 - MA: Bovespa Mais.

# Market Data B3: Binary UMDF

MESSAGE REFERENCE – VERSION 2.1.0

		6 - MB: Over the counter (SOMA Market). 7 - M2: Bovespa Mais Level 2.
<b>ImpliedMarketIndicator</b>	uint8	Indicates that an implied order can be created for the instrument. 0 - NOT_IMPLIED: Not implied. 1 - IMPLIED: Implied enabled.
<b>InstrAttribType</b>	uint8	Code to represent the type of instrument attributes. 24 - TRADE_TYPE_ELIGIBILITY: Trade type eligibility details for security. 34 - GTD_GTC_ELIGIBILITY: Eligibility for GTD/GTC.
<b>InstrAttribValue</b>	uint8	Code to represent the type of instrument attributes. 1 - ELECTRONIC_MATCH_OR_GTD_GTC_ELIGIBLE: Electronic Match Eligible (871=24) or GTD/GTC Eligible (871=34). 2 - ORDER_CROSS_ELIGIBLE: Order Cross Eligible (871=24). 3 - BLOCK_TRADE_ELIGIBLE: Block Trade Eligible (871=24). 14 - FLAG_RFQ_FOR_CROSS_ELIGIBLE: Request for Quote (RFQ) for Cross Eligible (871=24). 17 - NEGOTIATED_QUOTE_ELIGIBLE: Negotiated Quote Eligible (871=24).
<b>LotType</b>	uint8	Describes the lot type for the instruments. Used for the Equities segment. 1 - ODD_LOT: Odd lot. 2 - ROUND_LOT: Round lot. 3 - BLOCK_LOT: Block lot.
<b>MDEntryType</b>	char	Type of the Market Data Entry. "0" - BID: Bid. "1" - OFFER: Offer. "2" - TRADE: Trade or Trade Summary or Last Trade Price. "3" - INDEX_VALUE: Index Value. "4" - OPENING_PRICE: Opening Price. "5" - CLOSING_PRICE: Closing Price. "6" - SETTLEMENT_PRICE: Settlement Price. "7" - SESSION_HIGH_PRICE: Session High Price. "8" - SESSION_LOW_PRICE: Session Low Price. "9" - EXECUTION_STATISTICS: Execution Statistics for related Trades. "A" - IMBALANCE: Imbalance. "B" - TRADE_VOLUME: Trade Volume. "C" - OPEN_INTEREST: Open Interest.
